Trans-Critical CO2 control using UAPI controller

The UAPI controller has now been updated to include operation for trans-critical CO_2 refrigeration.

The trans-critical CO_2 features are included in v 6 of the UAPI firmware.

Please ensure that the JTL sales department is advised when ordering UAPI controllers, to insure that the parts supplied are suitable for this operation.

Version 6 is now the standard production issue and will be available as standard when current stocks are exhausted.

Products delivered prior to 05-June-2013 will definitely not be version 6.
